

Project Design Phase

Problem – Solution Fit Template

Date	October 2026	Team ID	6ab75a49da631abbf0cded44
Track	ServiceNow Administrator	Maximum Marks	2 Marks
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer		

Problem – Solution Fit

The Problem–Solution Fit identifies the customer problem and checks whether the proposed solution addresses that problem. For this ServiceNow Administrator project, the documented focus is streamlining IT procurement by automating standard laptop orders with Flow Designer. Specific current-state evidence, volumes, timings, and approval rules are not provided in the reference material and therefore remain validation items.

Purpose

- Understand the existing standard laptop procurement situation and the target users affected by it.
- Identify the procurement activities that are candidates for automation and the associated customer pain points.
- Define how Flow Designer is intended to support the standard laptop-order process.
- Align the proposed automation with the needs of the people involved in requesting, approving, and fulfilling standard laptop orders.
- Validate whether the proposed solution addresses the documented procurement problem.

Filled Problem–Solution Fit

Problem / Customer Need	Current Situation / Evidence	Proposed ServiceNow Solution	Expected Fit / Outcome
Problem: IT procurement for standard laptop orders needs to be streamlined through automation. Target need: A more structured and automated way to process standard laptop orders.	Documented evidence: The project is explicitly titled “Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer.” To validate: Current manual steps, delays, rework, handoffs, and affected user groups.	Proposed approach: Use ServiceNow Flow Designer to automate the standard laptop-order process. To define: Trigger, conditions, actions, approvals, notifications, and fulfillment steps.	Intended fit: The automation should directly address the need to streamline standard laptop procurement. To validate: Reduced manual effort, improved consistency, faster processing, and better process visibility.
Primary pain-point areas to validate: ■ Manual processing ■ Repeated data entry ■ Process delays ■ Multiple handoffs ■ Inconsistent processing ■ Limited visibility ■ Other: _____	Evidence to capture: • Current process steps • Stakeholders involved • Request volume/frequency • Common exceptions • Current turnaround time • Current pain points	ServiceNow elements: • Flow Designer • Standard laptop order/request process • Approval steps, if applicable • Notifications/actions, if applicable • Fulfillment handoffs, if applicable	Success indicators to validate: ■ Less manual work ■ Consistent workflow execution ■ Faster processing ■ Better visibility ■ Fewer avoidable handoffs ■ Clear ownership
Target stakeholders to confirm: • Laptop requester • Approver(s) • IT/procurement team • Fulfillment/support team Exact roles and ownership must be confirmed by the project team.	Impact to establish: Document the business impact of the current procurement process, including delays, effort, errors/rework, and user experience.	Flow to define: 1. Request initiation 2. Flow trigger 3. Conditions/business rules 4. Approval(s), if required 5. Actions/notifications 6. Fulfillment 7. Completion/closure	Fit evidence: Confirm that the implemented flow performs the required standard laptop-order steps and that stakeholders agree the automation addresses the identified problem.

Solution-Fit Check

Question	Filled response
Is the problem specific?	Yes. The reference project title specifically identifies IT procurement and standard laptop orders as the project focus.
Does the proposed solution address the stated problem?	The documented solution direction is Flow Designer automation for standard laptop orders. Detailed workflow requirements still need project-team validation.
What assumptions or dependencies need validation?	Current-state workflow; requester/approver roles; procurement and fulfillment steps; business rules; required approvals; notifications; exceptions; data requirements; and measurable success criteria.
What evidence demonstrates solution fit?	A validated current-state/problem statement, agreed future-state Flow Designer process, successful execution of standard laptop orders, stakeholder confirmation, and measured improvement against agreed baseline metrics.

Project Validation Items

- Confirm the exact current-state procurement workflow before implementation.
- Identify the exact stakeholders, approvals, conditions, actions, and fulfillment responsibilities.
- Define baseline and target measures for processing time, manual effort, exceptions, and visibility.
- Confirm which standard laptop orders are in scope and document out-of-scope scenarios.
- Record stakeholder sign-off that the proposed Flow Designer flow solves the identified procurement problem.
