

Project Design Phase

Solution Architecture – ServiceNow Administration

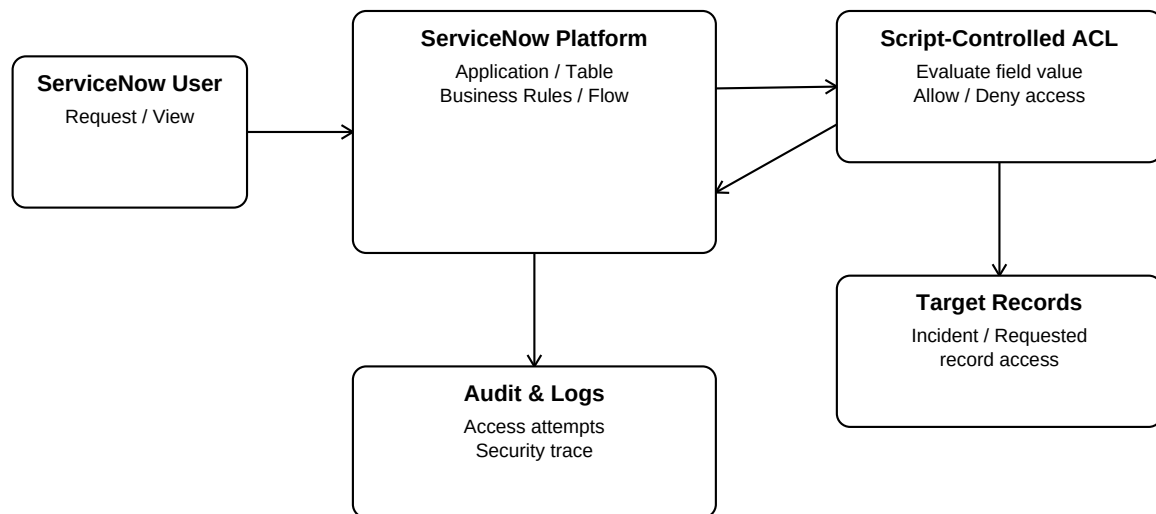

Date	October 2026
Team ID	6ab75a49da631abbf0cded44
Track	ServiceNow Administrator
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Documentation	Open Documentation
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture bridges the business problem and the technology solution. For the selected ServiceNow Administrator project, the architecture describes how a user request reaches the ServiceNow platform, how a script-controlled Access Control List (ACL) evaluates a field value, and how access to the target record is allowed or denied.

- **Access control:** restrict record access according to the required field value.
- **Platform structure:** represent the ServiceNow application, target table/records, and access-control layer.
- **Processing:** evaluate the field condition through the scripted ACL before record access is granted.
- **Traceability:** retain audit/log information for access attempts and security review.

Example – ServiceNow Solution Architecture Diagram:

Proposed architecture for the selected ServiceNow Administrator project

Figure 1: Proposed architecture and access flow for the Script-Controlled ACL project.

Architecture Components and Flow

Component	Purpose
ServiceNow User	Initiates a request or attempts to view a record.
ServiceNow Platform	Hosts the application, table, business logic, and security controls.
Script-Controlled ACL	Checks the configured field value and determines whether access is permitted.
Target Records	Records protected by the ACL rule.
Audit & Logs	Supports traceability of access attempts and security activity.

Implementation / Solution Requirements

- Create the required ServiceNow table/record context for the project.
- Configure the ACL on the appropriate record operation and field.
- Implement the field-value validation in the ACL script.
- Test permitted and restricted access cases and review the resulting logs.

Reference Project Titles

- Script-Controlled ACL – Restrict Record Access Based on Field Value
- Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
- Implement Client Script & UI Policy (Incident)
- Auto Ticket Classification using FLOW DESIGNER
- Import Data using Transform Maps (Spreadsheet)

Source basis: ServiceNow Administrator project title list and the supplied Solution Architecture sample template were used as the structural and terminology references.
