

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	October 2026	Team ID	6ab75a49da631abbf0cded44
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer	Phase	Ideation Phase

Project Context

The current IT procurement process for standard laptops involves manual handling and configuration steps. Requests may experience delays or oversight, creating user frustration and inefficient allocation of IT resources. The project uses ServiceNow Flow Designer to automate creation and assignment of configuration tasks after approval.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Selected problem statement: How might we streamline standard laptop procurement so that, after approval, configuration work is automatically generated and assigned to the Hardware team, reducing manual intervention, errors, and user wait time?

Step-2: Brainstorm, Idea Listing and Grouping

Idea / Solution	How it addresses the problem	Priority
Automated Catalog Task creation	Create a Catalog Task after the Service Catalog request is approved.	High
Automatic Hardware assignment	Set Assignment group to Hardware in the generated task.	High
Standard task description	Use the short description and description: "Laptop need to Configured".	High
Approval-based execution	Use the Service Catalog trigger and Approval = Approved.	High
Flow linked to Standard Laptop	Assign the "Standard Laptop Task" Flow to the Standard Laptop catalog item.	High
Status verification	Check Requested Item and Catalog Tasks to verify status and assignment.	Medium

Idea Grouping

Automation: Flow creation, Service Catalog trigger, Create Catalog Task action, automatic field values.

Assignment & Control: Hardware assignment, Approval = Approved, Standard Laptop catalog item linked to the Flow.

Validation: Order Now, request number, Approvers, Requested Item, Catalog Tasks status.

Step-3: Idea Prioritization

Prioritize ideas according to their direct contribution to automating approved Standard Laptop requests, assigning the Hardware team, reducing manual effort, and enabling verification.
